- Custom Logo can be included

347 x 163mm

General Description

The KSTM80-LED series features an 80 key industrial keyboard with an integrated 38mm industrial trackball.. The unit uses high brightness white LED's and the carrier plate acts as a light guide, lighting not only the legends but also the key edges, the trackball contour and custom logos. An external power supply is not necessary, the power from the keyboard port being sufficient.

The keyboard uses short travel switches with low pressure and positive tactile feedback and emulates all major key functions of a large multifunctional keyboard due to its "Fn" key mapping.

Units are available as OEM panel mount or as front panel mount versions and have PS/2 or USB compatible outputs for both the keyboard and trackball.

Backlight Control

The illumination intensity is increased by holding down the brightness control key on the keyboard. The illumination intensity is decreased by holding down the brightness key and the "Fn" key. The last dimming position is automatically memorised at power off and restored at power on.
